(PATENT)

### AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A circuit arrangement for electronic data processing comprising:  
having at least one non-volatile memory module for storing encrypted data to be protected against unauthorized access ~~by means of encryption or decryption~~;

having at least one memory module interface logic circuit in electronic communication with assigned to the memory module; said at least one memory module interface circuit being for addressing the memory module, for writing the data to the memory module, or for reading out the data from the memory module;

~~for addressing the memory module and~~

~~for writing the data to the memory module or~~

~~for reading out the data from the memory module;~~

having at least one code ~~R[ead]O[nly]M[emory]~~ Read Only Memory (ROM) module for storing and/or supplying at least one ~~R[ead]O[nly]M[emory]~~ ROM code; and

having at least one code ROM module interface logic circuit in electronic communication with assigned to the code ROM module for addressing the code ROM module and for reading out the ROM code from the code ROM module;

~~for addressing the code ROM module and~~

~~for reading out the ROM code from the code ROM module;~~

~~characterized in that at least one key code for encrypting or decrypting the data assigned to the memory module may be extracted and/or generated from wherein the at least one ROM code stored in of the code ROM module is used to generate at least one key code for encrypting or decrypting data being written to the memory module or data being read from the memory module, said at least one ROM code further being used for decrypting an address of said memory module.~~

2. (Currently Amended) A circuit arrangement as claimed in claim 1, ~~characterized in that wherein~~ the memory module interface logic circuit comprises at least one en-/decryption logic circuit

- having at least one key address generation unit and

- having at least one key register.

Docket No.: DE02 0274 US  
PELT-27,812  
(PATENT)

3. (Currently Amended) A circuit arrangement as claimed in claim 1, ~~characterized in that wherein~~ the code ROM module interface logic circuit comprises at least one multiplexing unit.

4. (Currently Amended) A circuit arrangement as claimed in claim 1, ~~characterized in that wherein~~ the memory module takes the form of

at least one ~~E[rasable]—P[rogrammable]R[ead]O[nly]M[emory]erasable~~  
programmable read only memory (EPROM),

at least one ~~E[lectrical]E[rasable]—P[rogrammable]R[ead]O[nly]M[emory]~~  
electrical erasable programmable read only memory (EEPROM) or

at least one Flash memory.

5. (Previously Presented) A microcontroller, in particular an "embedded security controller", comprising at least one circuit arrangement as claimed in claim 1.

6-10 (Cancelled)

11. (New) A method of retrieving encrypted data from a non-volatile memory for use by a microprocessor, said method comprising:

receiving, by a memory module interface logic circuit, an encrypted address from a central processing unit (CPU);

receiving, by a code ROM module interface logic circuit an address from the CPU;

using the address to read a key code from a code ROM;

providing the key code to the memory module interface logic circuit for decrypting the encrypted address into an unencrypted address;

reading encrypted data from the unencrypted address of said non-volatile memory by the memory module interface logic circuit;

decrypting said encrypted data using the key code, and

providing said decrypted data to said CPU.

Docket No.: DE02 0274 US  
PELT-27,812  
(PATENT)

12. (New) The method of claim 11, wherein receiving the encrypted address and receiving the address are performed in parallel.

13. (New) The method of claim 11, wherein the code ROM only stores key codes.

14. (New) A method of storing encrypted data into a non-volatile memory, said method comprising:

- receiving, by a memory module interface logic circuit, an encrypted address from a central processing unit (CPU);

- receiving, by a code ROM module interface logic circuit an address from the CPU;

- receiving, by the memory module interface logic circuit, data;

- using the address to read a key code from a code ROM;

- providing the key code to the memory module interface logic circuit for decrypting the encrypted address into an unencrypted address and for encrypting the data into encrypted data; and

- writing, by the memory module interface logic circuit, the encrypted data to the unencrypted address of said non-volatile memory.

15. (New) The method of claim 14, wherein said receiving steps are performed in parallel.

16. (New) A microcontroller comprising a security controller circuit, said security controller circuit comprising:

- a non-volatile memory for storing encrypted data;

- a memory module interface logic circuit for reading and writing encrypted data to and from said non-volatile memory;

- a code ROM for storing a plurality of key codes; and

- a code ROM module interface logic circuit for receiving an address from said microcontroller, for using said address to read a key code from said code ROM, and for providing said key code to said memory module interface logic circuit;

Docket No.: DE02-0274 US  
PELT-27,812  
(PATENT)

said memory module interface logic circuit being further for receiving an encrypted address and data from said microcontroller, for using said key code to decrypt said encrypted address, for encrypting said data, and for storing said encrypted data in said decrypted address of said non-volatile memory.
